UPCS  Guidance & Protocol Clarifications

Additional guidance regarding Site – Overgrown Vegetation and Site – Erosion.
Site - Overgrown Vegetation: **Acceptable**

(Example 1)

There is some vegetation touching a fence but it is not causing any damage. Is this a defect?

**Examples of vegetation contacting a fence that is acceptable – NO DEFECT**
Site - Overgrown Vegetation: Acceptable

Additional examples of vegetation contacting a fence that is acceptable – NO DEFECT
Examples of vegetation contacting a fence or building that is **NOT** acceptable

This is a DEFECT
Site - Overgrown Vegetation: Not Acceptable

Additional examples of vegetation contacting a fence or building that is NOT acceptable

This is a DEFECT
Often inspectors record a defect for erosion because the area under a tree or path that residence use does not have grass growing on it. This is not correct. Erosion shall be evaluated only if there is evidence of displaced soil.

Additional Examples of what is **NOT** Erosion
Industry Standards Notice

Understanding the Purpose & Application of this Notice

(Effective August 1, 2016)
Reasons for the Industry Standard Notice:

• Recently, many property owners/agents began preparing their properties for the REAC inspections by simply hiding the defect or making a substandard repair, in lieu of making an acceptable industry standard repair. Saving them time, money, and effort.

• The media, politicians, and our own HUD staff, have raised questions concerning substandard repairs of inspectable items.

• To minimize the possibility of the H&S hazards that may result from substandard repairs. i.e. misaligned or improperly vented water heaters.
Refocusing our Protocols and Inspectors

The “Industry Standard Notice” is directed at refocusing our UPCS inspectors and the UPCS inspection protocols. By doing this we will ensure that the properties affiliated with HUD are providing and maintaining their building/units in a way that provides housing that is decent, safe, sanitary, and in good repair.
5.703 Physical condition standards for HUD housing that is decent, safe, sanitary and in good repair

(a) Site. The site components, including sidewalks, parking, mailboxes, crosswalks, and street lights shall be in good repair. The site shall be free of refuse and shall not be a source of health and safety hazards and be in good repair. The site shall not contain abandoned or junked vehicles and shall not have evident indications of imminent fires.

(b) Building exterior. Each building in the site must be structurally sound, secure, habitable, and in good repair. Each building’s doors, air escapes, ventilations, lighting, locks, stairs, and windows shall be in good repair.

(c) Building systems. Each of the following must be in good repair: water, electrical system, elevators, emergency power, fire protection, HVAC and sanitary system must be free of health and safety hazards, functionally adequate, operable, and in good repair.

(d) Dwelling units.

(1) Each dwelling unit must be structurally sound, habitable, and in good repair. All areas and aspects of the dwelling unit (for example, the unit’s bathroom, call-for-aid [if applicable], and electrical systems, floors, hot water heater, HVAC (where individual units are installed), kitchens, lighting, outlets/switches, patios/balcony, smoke detectors, stairs, walls, and windows) must be free of health and safety hazards, functionally adequate, operable, and in good repair.

(2) Where fire protection is required, each dwelling unit must have hot and cold running water, including an adequate source of portable water (note for example that single room occupancy units need not contain water facilities).

(3) If the dwelling unit utilizes its own sanitary facility, it must be in proper operating condition, usable in privacy, and adequate for personal hygiene and the disposal of human waste.

(4) Each dwelling unit shall include at least one battery-operated or hard-wired smoke detector, in proper working condition, on each level of the unit.

(e) Health and safety concerns. All areas and components of the housing unit must be free of health and safety hazards. These areas include, but are not limited to, air quality, lead-based paint, structural hazards, fire, carbon monoxide, mold, mildew, infestation, and lead-based paint. For example, the building unit must be pest-free, mold and mildew-free, and have hand rails that are undamaged and installed at proper height. The building unit shall be free of rodents, cockroaches, mice, or other vermin, or of garbage and debris. The housing unit must have no evidence of washed out foundation, susceptible to termite or fire hazards. The dwelling units and outdoor equipment shall also be free of any condition of lead-based paint hazards and have available proper certifications of such (see 24 CFR part 35).

(f) Compliance with State and local codes. The physical condition standards in this section do not supersede State or local building codes for building and maintenance with which HUD housing must comply. HUD housing must continue to adhere to these codes.
200.929 Physical standards for housing ... intended to provide a sound basis for determining the acceptability of housing ... refer to material standards developed by industry and accepted by HUD ... contained in the Use of Materials Bulletin ... Materials Releases

FROM MPS HANDBOOK HUD 4910.1:

General

These Minimum Property Standards apply to buildings and sites designed and used for normal multifamily and care-type occupancy, including both unsubsidized and subsidized insured housing.
Rehabilitation construction includes the following categories: (1) all repairs to or replacement of present elements of an existing building, such as windows, stairs, flooring, or wiring; (2) rearrangement of rooms by the relocation of partitions or by the installation of or by the installation of

New bathrooms and kitchens; or (3) the general replacement of the interior of a building. This may or may not include changes to structural elements such as floor systems, columns or load bearing interior or exterior walls. Rehabilitation construction shall comply

with the standards for new construction and with the provisions of the program handbook for the particular program. New construction on cleared or vacant land or
Focus of the Industry Standard Notice

• All repairs to address UPCS deficiencies in preparation for a REAC inspection shall be made in a good and workmanlike manner with materials that are suitable for the purpose and free from defects. The phrase “good and workmanlike manner” means:
   a) Ensuring that the component, as repaired, performs its intended function/purpose; and
   b) Finishing the repair in a manner reasonably compatible with design and quality of the original and adjoining decorative materials.

• Ensure proper maintenance of each inspectable item based on industry standards

• Fix deficiencies – not just hide them

• Proper use of materials based on industry standards
Wall Cracks

Cracks in Brick Wall - Tuck-pointed using mortar is the correct means of repair; caulking is not appropriate.

Clarification/Exceptions
In addition to tuck-pointing, the use of newer (ASTM class) products designed specifically for repairing concrete cracks is also acceptable. These must be made in a professional manner and the repairs shall not be easily distinguishable. The use of interior/exterior painters caulking is not acceptable.
Example of an acceptable product

Polyurethane Mortar Joint Sealant
Product No. 8620-18

POLYURETHANE MORTAR JOINT SEALANT
Product No. 8620-18

PRODUCT DESCRIPTION
QUIKRETE® Mortar Joint Sealant is a textured one-component, fast-curing, flexible material providing a durable elastic bond.

PRODUCT USE
QUIKRETE® Mortar Joint Sealant is suitable for interior and exterior mortar joint applications. QUIKRETE® Mortar Joint Sealant Adhesive has excellent adhesion to concrete, masonry, stucco, pre-painted metal, glass, plywood, aluminum, steel and many plastics and composites.

SIZES
QUIKRETE® Mortar Joint Sealant is available in 10.1 oz (300 ml) tubes

YIELD
Each 10.1 oz (300 ml) tube can be applied to approximately 12 lineal feet (3.7 m) in a 3/16” (10 mm) bead

TECHNICAL DATA

QUIKRETE® Mortar Joint Sealant, when tested in accordance with standard procedures, provides typical results as listed in Table 1.

APPLICATION
Remove dirt, oil, moisture and/or old adhesive. Sand or grind if necessary to expose a sound surface. Cut plastic tip to desired size and puncture airtight seal at base of tip. Using a caulk gun, apply caulking to one of the surfaces to be bonded. Force sealant into gaps or cracks and smooth bead to desired shape. Be certain to fill all gaps when working on rough surfaces. QUIKRETE® Mortar Joint Sealant will bridge gaps up to 3/8” (10 mm) wide.

Cracks in Brick Wall: Not Acceptable (Example 6)
Access Holes in Drywall

**Drywall Repair** – Sheetrock with mud and/or tape is the correct means of repair. Simply covering a hole or damaged drywall with plywood/laminate is not correct.

**Clarification/Exceptions**
The exception to this rule regarding sheetrock repair is for intentional holes in the sheetrock to allow for access to plumbing, electrical, telephone, etc. These access points shall be covered, secured, and may use alternate materials other than sheetrock to cover the access point. The inspector will require that a sampling of these access point covers be removed to verify the purpose of the cover.
Access Holes in Drywall: Acceptable

(Example 7)
Hole in Drywall Repair: **Acceptable**

Additional examples of Drywall repairs. (obviously needs paint)
Repairs of a hole in a wall: Not Acceptable

Examples of Unacceptable Wall & Drywall repairs.
This is a DEFECT
Acceptable Uses for Corrugated Pipe

**Downspouts** – Same materials, shape and design are correct. Plastic or PVC piping is not correct.

**Clarification/Exceptions**
The plastic corrugated and PVC piping is acceptable if used for its intended purpose.

The plastic corrugated piping is acceptable if used as an extension at the end of the downspout to assist with directing water away from the foundation but shall not be used as part of the gutter/downspout system attached to the building.
Downspouts & Corrugated Piping: Acceptable

Examples of Acceptable applications for plastic corrugated piping
Example of **Unacceptable** applications for plastic corrugated piping
Downspouts & PVC Piping: **Acceptable** (Example 12)

PVC piping will be allowed provided it is properly installed (as shown in the photo below) and is painted to match the adjoining gutter/downspout system.
Downspouts & PVC Piping: Acceptable

(Example 13)
Downspouts & PVC Piping: Not Acceptable

Example of **Unacceptable** applications for PVC piping
Site - Erosion

Erosion – Correcting the root cause of the erosion is the correct means of repair, for example, correct or repair the drainage or add fill-soil. Simply hiding or covering the erosion with mulch or straw is not correct.

Clarification/Exceptions
Often we find that the property hides the evidence of erosion by covering the grounds with mulch, wheat straw, pine straw or other ground cover in lieu of correcting the cause. As the inspector, if you see evidence that this is the case while inspecting the property, you will investigate further to assess if erosion is ongoing and just hidden from view or if the appropriate repairs (fill dirt, seeding, piping, etc.) have been done and the ground cover is just an integral part of the process. (ex: Wheat straw to cover newly seeded areas)
Site – Erosion: Not Acceptable

Examples of Unacceptable Erosion Control
Electrical Devices: Not Acceptable

Electrical Panels and Disconnects - Installing a correct panel cover or using manufactured blanks is the correct means of repair. Using caulking or expandable spray foam to fill the gaps is Unacceptable
Refrigerator Gasket – Replacing the gasket is the correct means of repair. Using white electrical tape, fingernail polish, white-out, etc., is Unacceptable.

Clarification/Exceptions
A one inch split or tear in the refrigerator gasket that has been repaired is no longer a defect. However, anything other than this will be recorded as a defect.
Unit – Refrigerator: Not Acceptable

(Example 18)
Inspection of the gas water heater/gas HVAC vent piping: The piping shall be inspected to ensure that it has no gaps in the piping (sometimes hidden by tape) and the piping size runs from either one continuous size or runs from smaller to larger beginning with the smaller piping at the water heater.
Unit – Water Heater: Not Acceptable

Examples of Unacceptable and Incorrect Gas HVAC/Water Heater Venting
Unit – Water Heater: Not Acceptable

Examples of Unacceptable and Incorrect Gas HVAC/Water Heater Venting
Appeals:

Property representatives may use the Technical Review/Database Adjustment process to appeal deficiencies cited in which non-industry standard repairs were made if the property’s management believes a deficiency should not have been recorded.

The appeal process is the same as appealing any other item and requires the property representative to present appropriate documents that support the repair meets industry standards. Such appeal documents/information must contain both the supporting industry standard documents, as well as written justification by a third-party subject matter expert for the particular deficiency type being appealed.
Caution:

• This notice is not intended for our UPCS inspectors to use as a means to record inspectable items as being deficient due their own preference or bias.

• It should not be used to address code issues.

• The inspector will enter “NIS”, meaning Not Industry Standard, in the comments field for each deficiency that the inspector records due to the substandard repair. This will allow REAC to track where and how many times these types of issues occur.
